Overview

The solar collector is a type of solar panel designed to take advantage of solar thermal energy. These elements capture solar radiation and convert it into thermal energy, into heat. They are often covered by gl. The primary circuit of a solar thermal energy installation is a closed circuit, it transports the heat from the collector to the accumulator (system that stores heat). The heated liquid (wa. The heat exchanger heats the drinking water through the heat captured from solar heating systems. It is located in the primary circuit, at its end. It is shaped like a serpentine, sinc. The storage tank is a tank where the heated water useful for consumption accumulates. It has an inlet for cold water and an outlet for hot. The cold enters below the accumulator. The secondary or consumption circuit, (open circuit), enters cold supply water and at the other end the heated water is consumed (shower, sink.). The cold water goes throu.
