

Lithium battery damage due to high temperature

Overview

Lithium-ion batteries, with high energy density (up to 705 Wh/L) and power density (up to 10,000 W/L), exhibit high capacity and great working performance. As rechargeable batteries, lithium-ion batteries serve as electrochemical batteries, first invented by Alessandro Volta in 1800, have. Most of the temperature effects are related to chemical reactions occurring in the batteries and also materials used in the batteries. Regarding chemical reactions, the relationship between the distribution of temperature at the surface of batteries is easy to acquire with common temperature measurement approaches, such as the use of thermocouples. Thermal challenges exist in the applications of LIBs due to the temperature-dependent performance. The optimal operating temperature range of LIBs is generally limited to 15–35 °C. P. Tao, T.
