

Organic solar cell manufacturing

Overview

An organic solar cell (OSC) or plastic solar cell is a type of photovoltaic that uses, a branch of electronics that deals with conductive organic polymers or small organic molecules, for light absorption and c. A photovoltaic cell is a specialized semiconductor diode that converts light into (DC) electricity. Depending on the of the light-absorbing material, photovoltaic cells can also convert low-energy. In organic solar cells, junctions are the interfaces between different layers or materials within the device's structure. These interfaces contribute to the separation and collection of charge carriers (electrons and ho. Since its active layer largely determines device efficiency, this component's morphology received much attention. If one material is more soluble in the solvent than the other, it will deposit first on top of the.
