

Simple circuit diagram of capacitor

Overview

A capacitor is made up of two metallic plates with a dielectric material (a material that does not conduct electricity) in between the plates. And there's actually no more magic to it. It's that simple and you can even make. I like to answer the question of "How does a capacitor work?"

" by saying that a capacitor works like a tiny rechargeable battery with very low capacity. But a capacitor is usually charged and discharges. If you want to get a really good understanding of capacitors and how to use them in your circuits, there are two important things you need to know: 1. What happens to the voltage. There are many different capacitor types. But when you start out, the main thing to remember is the difference between a polarized and a non-polarized capacitor. A polarized capacitor. Capacitors are used for a lot of things, such as: 1. Adding a time delay in a circuit 2. Making oscillators (for example to make a light blink) 3. Creating audio filters (such as low-pass and high-pass).
