

# What is the liquid that comes out of the battery when it is charged

## Overview

The liquid inside a battery is called the electrolyte. It plays a crucial role in enabling the flow of electric charge between the battery's positive and negative electrodes. Without the electrolyte, batteries would not function. Batteries come in two main categories: primary batteries, which are disposable, and secondary batteries, which can be recharged. Let's take a look at both types: The type of liquid electrolyte used in a battery depends on the specific chemistry of the battery. Let's examine the electrolytes in some common battery types: The liquid inside a battery, known as the electrolyte, is a critical component that enables the flow of electric charge and facilitates redox reactions. Electrolytes vary depending on the battery type and chemistry, and their properties are crucial for the battery's performance. What is the liquid inside a battery called?
